CASE STUDY

GIBUS S.P.A

GIBUS PORTAL

ADVANCED IDENTITY AND ACCESS MANAGEMENT

THE SUN FACTORY • ITALY

BACKGROUND

GIBUS is an Italian company founded in 1982 leader in the design and production of awnings and pergolas and multiple accessories such as windows, lighting systems, sound systems, and heaters.

For years GIBUS has been bringing the Made in Italy in the world, the excellence, the authenticity of a culture of the sun, of the Italian style in living the light.

GIBUS PORTAL

Business Needs

Providing thousands of dealers, distributed worldwide, with a single point of access to the services GIBUS makes available to them to ensure secure and managed access to the resources provided, thus decreasing users and credentials management costs.

Challenges

Gibus is a well-established company on the international market that collaborates with professional figures and ateliers worldwide.

Gibus provides countless applications and tools to its dealers, employees, and customers, the security of which has quickly become a critical task for the company, especially in terms of management operations and resources association.

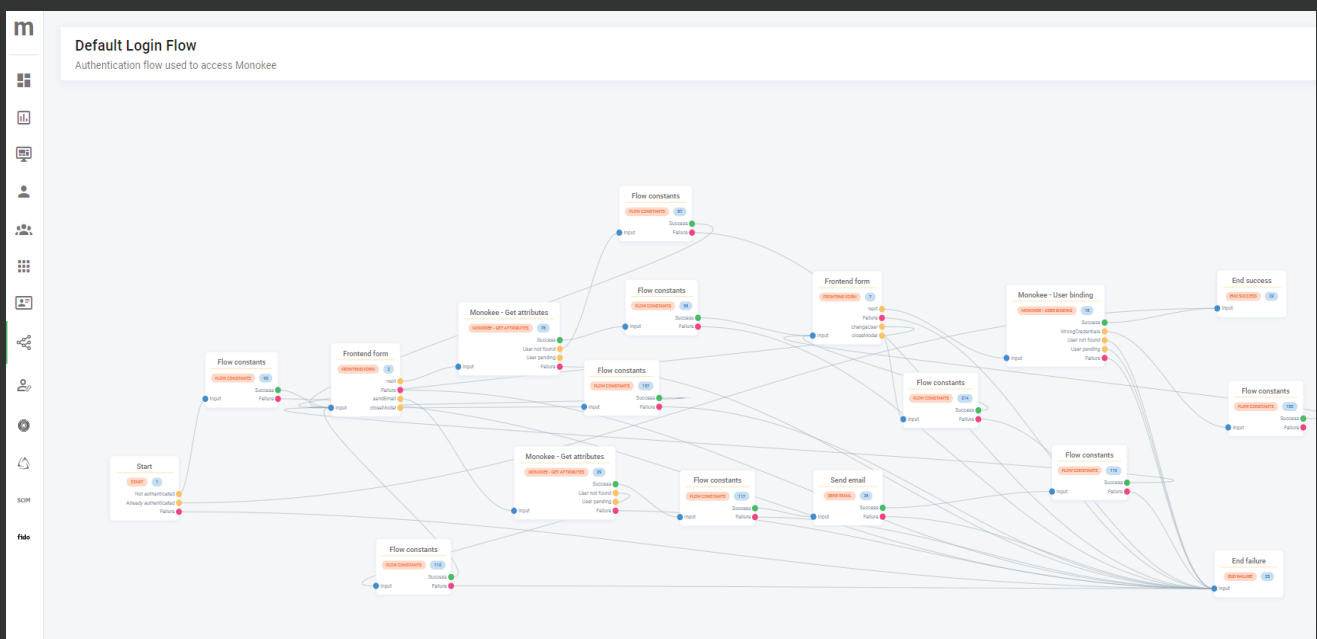

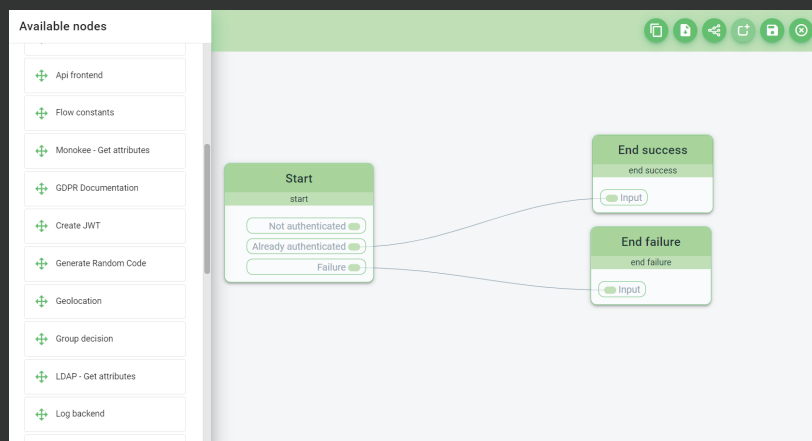

Monokee's top tool: The "User Journey" Visual Builder

To address Gibus' challenges, Monokee planned, customized, and deployed its primary Identity and Access Management tool: the "User Journey" visual builder. A what-you-see-is-what-you-get engine that enables the configuration of authentication and authorization flows independently from the targeting platforms.

For a system administrator with this tool, connecting multiple custom services with a centralized identity provider is just a matter of a few clicks. Each component, called a block, is dynamically created based on three primary types:

- **Front-end blocks** present the user with a conventional dynamically-generated page, such as credential form and QRCode challenges;
- **Back-end blocks** perform "behind the scenes" operations, such as API interaction and token generation;
- **Library blocks** encapsulate previously generated flows to be reused as complex building components, for example, FIDO MFA or HSM interaction.

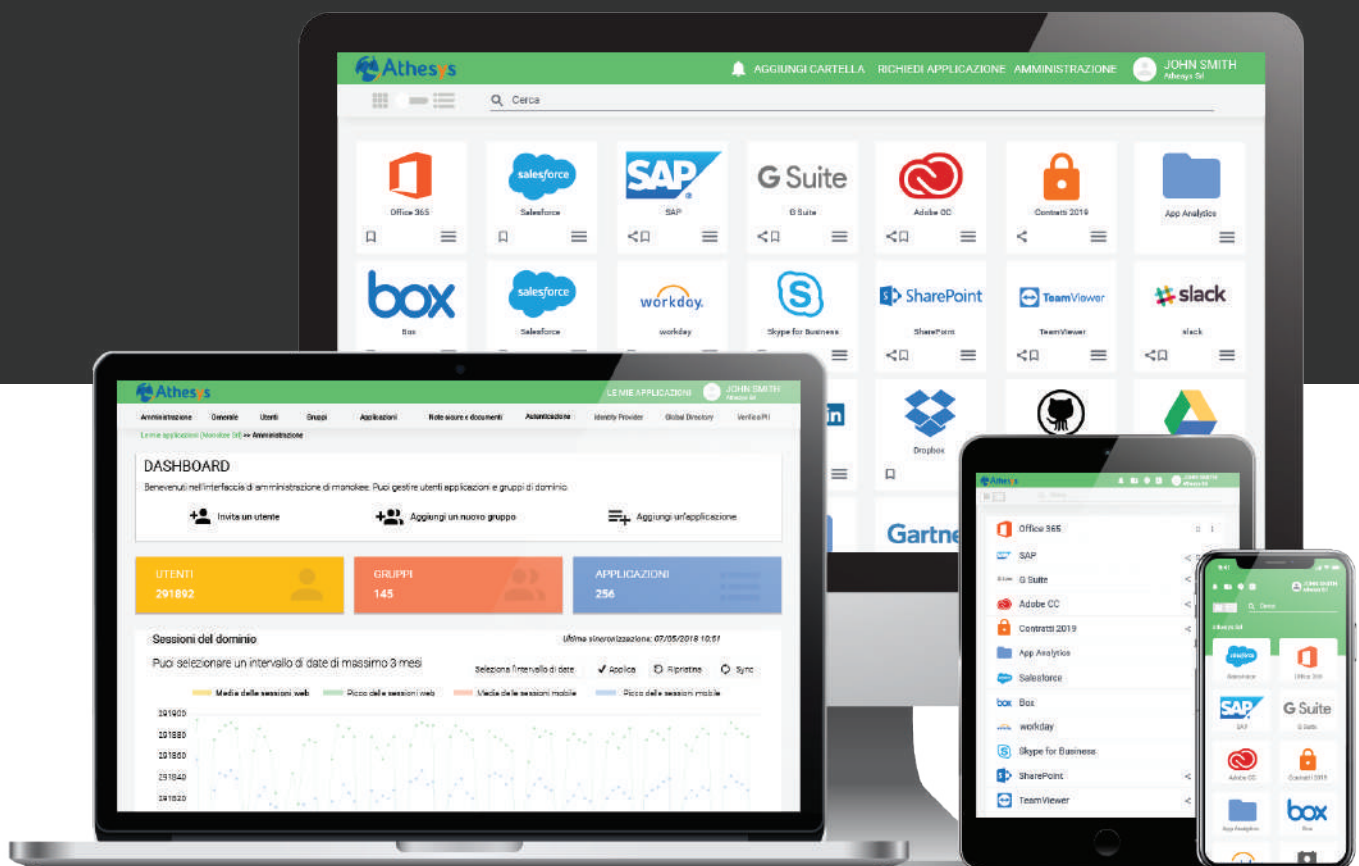

Solution

Monokee has partnered with Gibus to intuitively and efficiently manage the processes and functionality related to digital identities with a flexible, intuitive, secure, and powerful tool that enables:

- User provisioning, management, and access to the company portal;
- Third-party tools passwordless authentication and authorization processes through the use of SAML2.0 federation protocol where Monokee plays the role of Identity Provider;
- Full customization of designed user flows, including login pages and profile management;
- E2E secure channel that integrates and synchronizes the user data across all services;
- Secure API endpoints for employees and associates.

"Monokee has proven to be a platform fundamental to the project's success, not only for the completeness of functionality and ease of use but also for the flexibility and scalability necessary to meet our specific needs."

Alberto Bottelli
Gibus IT Manager
